Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δ
                                                                                                                                                      cell-associated activity at a tumour site. They can also be used for preventing an inhibiting an indication associated with haematopoietic cell recruitment or histamine release from basophils or mast cells. They can also be used to modulate the chemokine-induced activity of haematopoietic cells at a preselected physiological site, to treat a vascular indication, e.g. coronary artery disease, myocardial infarction, unstable angina pectoris, atherosclerosis, or vasculitis, lentiviral infection or replication (e.g. HIV), low bone mineral density, a parasitic infection in a vertebrate animal (e.g. malaria), an autoimmune treat psoriasis in a mammal, to enhance wound healing, to prevent or treat asthma, organ transplant rejection, rheumatoid arthritis or the arachidonic acid pathway and where leukotriene, thromboxane and/or prostation as inhibited and to prevent or inhibit an indication crostaglandin are inhibited and to prevent or inhibit an indication associated with elevated TNF-alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chemokine; immune response; monocyte chemoattractant protein-1; MCP-1; chemokine-induced activity; inflammatory response; vascular indication; haematopoietic cell-associated activity; umour; ocronary artery disease; myocardial infarction; unstable angina pectoris; atheroscierosis; asthma; vasculitis; lentiviral infection; low bone mineral density; suppressor; parasitic infection; autoimmune disease; psoriasis; wound healing; organ transplant rejection; rheumatoid arthritis; allergy; therapy; arachidonic acid pathway.
                                                                            This sequence represents a fragment of the chemokine MCP-1. The invention relates to chemokine peptides and mimetics, particularly derived from monocyte chemoattractant protein-1 (MCP-1). The chemokine peptides and variants and derivatives on inhibit or reduce or increase, or enhance chemokine-induced activity. They can be used for increasing or enhancing an inflammatory response, an immune response or haematopoietic
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This sequence represents a fragment of the chemokine hMCP-1.

The invention relates to chemokine peptides and mimetics, particularly derived from monocyte chemotizatant protein-1 (MCP-1). The chemokine peptides and variants and derivatives can inhibit or reduce or increase, or enhance chemokine-induced activity. They can be used for increasing or enhancing an inflammatory response, an immune response or haematopoietic cell-associated activity at a tumour site. They can also be used for preventing or inhibiting an indication associated with haematopoietic cell recruitment or histamine release from basophils or mast cells. They can also be used to modulate the chemokine-induced activity of haematopoietic cells at a preselected physiological site, to treat a vascular indication, e.g. coronary artery disease, myocardial infarction, constable angina pectoris, atheroselecosis, or vasculitis, lentiviral infection or replication (e.g. HIV), low bone mineral density, a infection in a vertebrate animal, to prevent or treat psoriasis in a mammal. To enhance wound healing, to prevent or treat asthma, organ transplant rejection, rheumatoid arthritis or allergy. They can also be used to inhibit a product or intermediate in the arachidonic acid pathway and where leukotriene, thromboxane and/or prostaglandin are inhibited and to prevent or inhibit an indication conservated mith elevated TNF-alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Macrophage recruitment; chemokine derivative; MCP-1; osteoporosis; monocyte chemoattractant protein-1; inflammation; atherosclerosis; HIV; MIDS; stroke; psoriasis; autoimmune disease; hypertension; endotoxaemia; basophil-mediated disease; myocardial infarction; acute ischaemia; rhemmatoid arthritis; contraception.

The chemokines include sequences AAB15785-B15794, AAB15803-B15813 and AAB15813-B15848. These chemokine derivatives can be used to treat diseases such as autoimmune diseases, atherosclerosis, osteoporosis, HIV infection and AIDS, psoriasis, inflammatory diseases, hypertension, basophil mediated diseases, endotoxaemia, myocardial infarction, acute ischaemia and rheumatoid arthritis, and can be used to prevent strokes and as contraceptives. The coding sequences for the chemokines can be used in
New peptide 3, amide and heterocyclic compounds and saccharide conjugates used for inhibiting chemokine induced activity and treating e.g. stroke, vascular diseases, autoimmune diseases a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention concerns the identification of a number of chemokines which can be used to produce derivatives, agonists and antagonists which are then useful in disease treatment. The chemokines include sequences AAB15785-B15794, AAB15803-B15813 and AAB15811-B15848. These chemokine derivatives can be used to treat diseases such as autoimmune diseases, atherosclerosis, osteoporosis, HIV infection and AIDS, psoriasis, inflammatory diseases, hypertension, basophil-mediated diseases, endotoxaemia, myocardial infarction, acute ischaemia and rheumatoid arthritis, and can be used to prevent strokes and as contraceptives. The coding sequences for the chemokines can be used in
                               detrimental cytotoxic T lymphocyte responses. These compounds mimic or interact with a surface feature (such as SHN, KIT, SSK, DEK and RDT) of the CD8/MHCI complex. This is useful in meno +harmonic transfer.
                                                                                                  Disclosure;
                                                                                                                                                                             WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where F1 = an FC domain; X1 and X2 = are each independently selected from -(U1)C-P1, -(L1)C-P1-(L2)d-P2.

(L1)C-P1-(L2)d-P2-(L3)e-P^3, or -(L1)C-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently selected that expendently expensive of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a b, c, d, e, and f = are each independently linkers; and a b, c, d, e, and f = are each independently linkers; and an b, c, d, e, and f = are each independently linkers; and a b, c, d, e, and f = are each independently linkers; and a b brown of interesting cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein contains complement fixation, and possibly placental transfer. AAA69443 co AAAA69526 and AAB16955 to AAB18013 represent invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel recombinant DNA molecules encoding subtilisin-like serine protease, useful for producing transgenic plants with altered stomata, lower water consumption and enhanced diseased resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences encoding SDD1, a subtilisin-like serine protease, can be used to produce transgenic plants with altered stomata characteristics. These plants exhibit improved freshness, increased ary weight, reduced leaf temperatures, reduced water loss and lower water consumption and for enhancing the sugar and/or protein content of plant leaves, modulating CO_2 uptake into and H_20 release from leaves, for sustained photosynthesis under high intensity conditions or for the improvement of disease resistance of plants. The transgenic plants and cells of such plants are useful in the preparation of feed, food or additives.

                            blood vessel regression in a mammal, enhancing drug delivery to the central nervous system, treating a demyelinating neurological disease, increasing vasopermeability in a mammal, enhancing adhesion of nonclassical cadherin-expressing cells, inhibiting synaptic stability in a mammal, or preventing pregnancy in a mammal. They can also be used for e.g. enhancing or directing neurite outgrowth, facilitating wound healing or reducing scar tissue, or enhancing adhesion of foreign tissue in a mammal. They can also be used for treating e.g. psoriasis, arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for detection and diapnosis and in bioreactors. AAY60592 to AAY64572 represent specifically claimed peptides, and AAY64573 to AAY6453 and AAZ33183 to AAZ33186 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                              inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, enhancing delivery of a drug through the skin of a mammal, enhancing delivery of a drug to a tumour in a mammal, treating cancer a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cadherin related neuronal receptor; LI-cadherin; protocadherin;
desmoglein; desmocollin; calcium binding; cancer; tumour; obesity;
rheumatoid arthritis; multiple sclerosis; diabetes; metastasis;
                                                                                                                                                                                                                                                           angiogenesis in a mammal, inducing apoptosis in a nonclassical cadherin-
expressing cell, preventing or treating obesity in a mammal, stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cadherin modulating agents, used for modulating nonclassical cadherin-mediated functions for treating e.g. cancers, obesity, rheumatoid arthritis, multiple sclerosis, diabetes or a neurolog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            OB-cadherin;
cadherin-12;
                                                                                                                                                                                                                                                                                                                                                                  recognition (CAR) sequence. The MAs can be used for modulating nonclassical cadherin-mediated functions. They can be used for e.
                                                                                                                                                                                                                                                                                                                                                                                    comprising peptides which comprise a nonclassical cadherin celrecognition (CAR) sequence. The MAs can be used for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 78;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Blaschuk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-MAY-1999;

The present invention provides compositions which can be used to inhibit detrimental cytotoxic T lymphocyte responses. These compounds mimic or interact with a surface feature (such as SHN, KIT, SSK, DEK and RDT) of the CD8/MHCI complex. This is useful in gene therapy, in the treatment of diabetes and in tissue transplantation.
                                                                                                                                                                                                                                             Composition for inhibition of detrimental cytotoxic T lymphocyte responses comprising a compound that mimics or interacts with a surface feature of the CD8/MHC I complex -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rb-interacting zinc finger; RIZ; retinoblastoma; heart disease; cell proliferation; cell differentiation; tissue repair; transcription regulator; breast cancer; gene therapy; melanoma; neuroblastoma; leuvedraemia; Parkinson's disease; Huntingdon's disease; Alzheimer's disease; paralysis; motor neurone disorder; 64 GTPase motif; EF-Tu/ Ha-RAS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for inhibiting thrombin activation in a human cell expressing protease activated receptor 1 (PARI). The method involves using peptides (e.g. the present peptide) that inhibit platelet activation. The method is useful for preventing thrombosis and platelet aggregation. The method can be used for patients with acute coronary syndromes (e.g. cresendo angina, myocardial infarction) and for individuals who have acute coronary syndromes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                receive percutaneous transluminal coronary angioplasty with an artificle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transcription. RIZ functions to maintain cells in the G1 phase of the cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell nucleus. RIZ gene mutations may be implicated in various cancers such as melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may be used in gene therapy for these disorders. Since RIZ protein is implicated in cell cycle arrest, inhibition of RIZ activity may be useful in neurodegenerative disorder therapy e.g. for Parkinson's, Huntingdon's or Alzheimer's disease, paralysis or motor neurone disorders, or cardiac disorders e.g. heart disease, where the ability to induce neural cardiac tissue proliferation would be useful. The present
This peptide represents a matrix metalloprotease (MMP) inhibitor peptide of the formula: aa1-aa2-aa3-aa4-C where aa1 and aa4 is R or K; aa2 is K,
                                                                                                                                                                                                                                                                                                                                                                                  Matrix metalloprotease; inhibitor; tissue damage; angiogenesis; arthritis; tumour growth; granulomatous inflammatory condition; metastasis; sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GTPase motif is found in rat RIZ (AAB12104). RIZ is retinoblastoma (Rb)-interacting zinc finger (RIZ) protein. RIZ is a nuclear phosphoprotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to Rb protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate the protein control of the regulating cell proliferation. In addition, RIZ can act to regulate the regulating cell proliferation.
                                               Claim
                                                                           Matrix metallo:proteinase peptide(s) - used treating tissue damage caused by activated of

                                                 This peptide represents a matrix metalloprotease (MMP) inhibitor peptide of the formula: aal-aa2-aa3-aa4-C where aal and aa4 is R or K; aa2 is K, O or N; aa3 is P, A, G, L, I or V; and C is a cysteine having a free sulphydryl group. The peptides can be used to treat tissue damage caused by activated MMPs, e.g. for treating inappropriate anglogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. ```
AAQ91625 encodes AAR77331 a human/old world monkey apolipoprotein (a) (apo(a)) antigenic peptide. The peptide can be used to raise antiapo(a) antibodies, for use in immunoassays for the detection of apo(a). The DNA sequence can be used as a primer and/or probe for the detection, and quantification of apo(a) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immuno:reactive peptide(s) of apo:lipoprotein - used for prodn. of antibodies and development of immunoassays, for the detection and quantification of apo(a)
